## HIGH POWER CONDENSING WALL-HUNG BOILER

The high-power condensing wall-hung boiler GENUS PREMIUM EVO HP is the maximum technological innovation expression of the new ARISTON brand boilers in terms of efficiency, ecology, comfort, installation flexibility and use.

The great improvement of the new wall-hung boiler will allow to manage up to 8 boilers in back to back cascade installation, and up to 6 boilers in line installation (with the new cascade control unit RVS 63), to ensure a higher overall efficiency and lower costs.

GENUS PREMIUM EVO HP boiler, by using a heat exchanger in stainless steel AISI 304L, and thanks to the fully premix combustion system guarantees maximum efficiency (4 combustion efficiency stars) and extremely low polluting emissions (NOx 5 class).

GENUS PREMIUM EVO HP is perfect both for heating domestic systems with high volume (two-family, multi-family houses, blocks of flats), and business/industrial activities.

In case of boiler single installation or in cascade one, it is possible to connect a separate tank for the domestic hot water production with an external three-way valve or a dedicated pump.

In case of operation in cascade, it is possible to connect the boilers to flow/return distribution collectors, easy to assemble. A separate hydraulic separator allows to adapt the heat generator to the system characteristics. The generators can be installed both on the wall and in any point of the thermal station thanks to an appropriate self-supporting frame.

The management of the boilers in cascade, besides the rotation (to obtain the same operation time for the different boilers), also allows the di-

vision of the power supplied on more generators so that the ratio power/exchange surface allows to exploit at maximum the condensing heat exchanger technology.

The wide DOT MATRIX LCD display with blue backlit is completely customizable both in terms of information shown (base or complete initial display) and of backlight level.

GENUS PREMIUM EVO HP can be used to make advanced systems with high efficiency since it is arranged for the connection with a wide range of climatic thermoregulation devices (Sensys, room sensor, outdoor sensor, ...) and of hydraulic modules for managing multi-zone and multi-temperature heating systems. Lastly, since it is also arranged for the integration and management of solar thermal systems, GENUS PREMIUM EVO HP is the perfect solution for systems that use renewable energy sources.

## 2. Specification description

### GENUS PREMIUM EVO HP 45 - 65 - 85 - 100 - 115 - 150

Condensing wall-hung boiler, forced flow sealed chamber, for heating internal installations.

#### Combustion group

- Condensing technology with fully premix system that has very high efficiency on all the modulating range;
- The exchanger consists of smooth stainless steel pipes that ensure the maximum thermal exchange. Inside it, it integrates the additional flue gas exhaust functions, manual air release valve, condensate discharge;
- Ionization electronic control with ignition and flame detection electrodes;
- "Premix" burner – fully air/gas premix in stainless steel consisting of: an external perforated casing where the combustion takes place, an internal perforated casting for the internal gas diffusion balancing, working with all gas types;
- Integrated regulation gas valve and venturi for the air-gas mixture;
- Self-adapting and modulating fan with electronic speed change,
- NTC contact probes on primary flow and return for temperature controls;

#### Hydraulic group

- Two speed circulation pump, autoadaptive according to the system flow and return temperature difference (only for 45-65 kW);
- Automatic air release function of the air release (only for 45-65 kW) the heating system;
- Two speed autoadaptive pump (available as accessory for 85-100 kW), and full modulating pump (available as accessory for 85-100-115-150 kW) autoadaptive according to the system flow and return temperature difference;
- Pumps with integrated automatic air release valve, based on the system flow and return temperature difference;

#### Condensate and flue

- Condensate discharge through integrated siphon with inspection directly accessible;
- Combustion analysis intakes integrated in the flue gas exhaust connector;
- Coaxial flue gas exhaust connections, 80 / 125 mm (air/flue gas split configuration 80 / 80 with appropriate accessory), for 45-65 kW; split flue exhaust connections, diameter 100/100, for 85-100-115-150 kW;

#### Electronics

- Microprocessor P.C.B;
- The wide blue backlit LCD DOT MATRIX display is fully customizable both in terms of information shown (base or complete initial display) and of backlight level;
- Arranged for system configuration integration through

the new bus bridgenet communication protocol;

- Self-diagnosis system with setting visualization on the LCD DOT MATRIX display of operation technical parameters and failure codes;

#### Arranged for thermoregulation, heating and solar thermal systems' management

- Arranged for multi-zone climatic thermoregulation;
- Arranged for multi-temperature and multi-zone system management modules' connection;
- Arranged for solar thermal systems' management and integration;

#### Safety and control

- Low pressure switch integrated in the boiler;
- Anti-freeze protection system on heating operating on two temperature levels (at 8°C only circulation pump activation, at 3°C burner activation);
- Primary heat exchanger over-temperature protection, water side, through primary circuit flow probe limit temperature;
- Primary heat exchanger over-temperature protection, flue gas side, through thermal fuse;
- Primary heat exchanger over-temperature protection, flue gas side, through thermostat and additional thermofuse on 85-100-115-150 kW;
- Primary circuit water circulation lack protection through flow and return temperature probes;
- Circulation pump anti-lock system that activates every 21hours if the boiler hasn't been used for this amount of time;
- Post-circulation system on the heating circuit;
- Filters on heating and circuits;
- Anti-freeze protection system on the heating and operating on two temperature levels (at 8°C only circulation pump activation, at 3°C burner activation);
- IPX4D protection rating (IP20 for 115-150 kW);

#### Special functions

##### Heating

- Automatic air release function for the air release from the heating system;
- "Chimney sweep" function for the combustion analysis;
- "AUTO" function to optimize automatically the boiler heating mode, according to the room and external conditions;

##### Domestic hot water

- The domestic hot water production is allowed through the connection with 3 way valve kit;

##### Accessories included

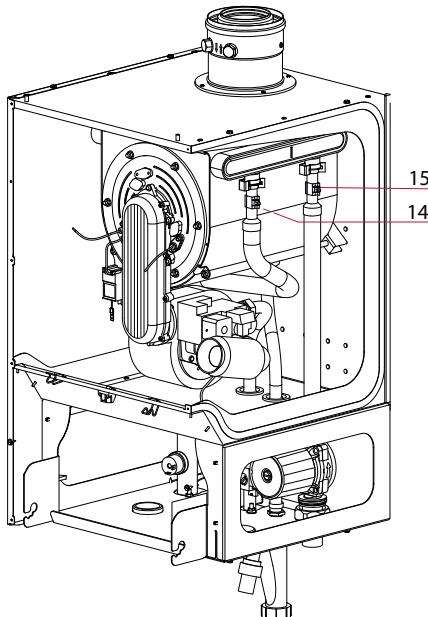

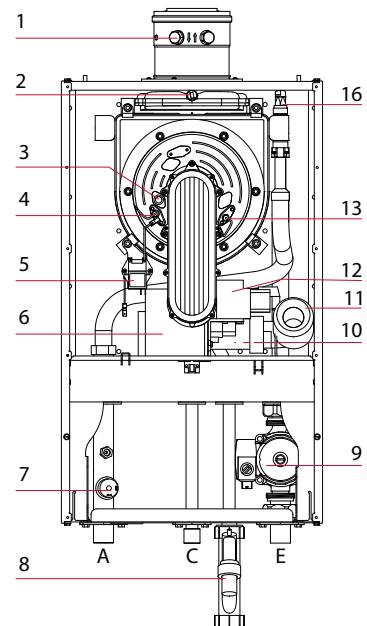

- Wall-fixing bracket;
- LPG conversion kit;

## 7. Air intake/ flue gas exhausts

### EUROPEAN REGULATION UNI 10642

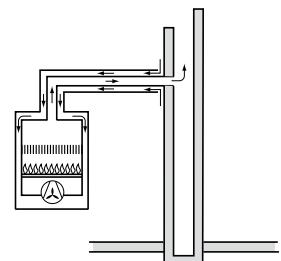

#### Boiler Type Classification

Type B - Combustion air taken from the room in which the appliance is installed

- B22 External flue gas exhaust
- B23 Air intake from the room

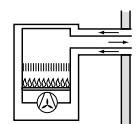

- B32 Flue gas exhaust through individual or shared flue ducting integrated into the building
- B33 Air drawn from the room

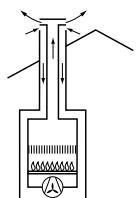

Type C - Combustion air drawn from outside

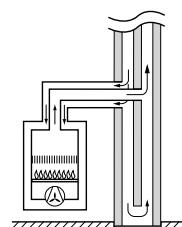

- C12 Flue gas exhaust and air intake duct through external wall in the same range of pressure

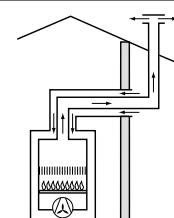

- C32 Flue gas exhaust and air suction duct from outside with roof terminal in the same range of pressure

- C42 Individual or shared flue gas exhaust and air suction through flue ducting built into the building

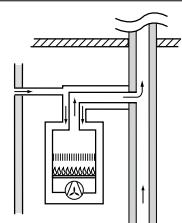

- C52 Flue gas exhaust leading outside and air intake duct through external wall not in the same range of pressure

- C62 This appliance is approved for connection to air intake and exhaust systems which have received separate approval

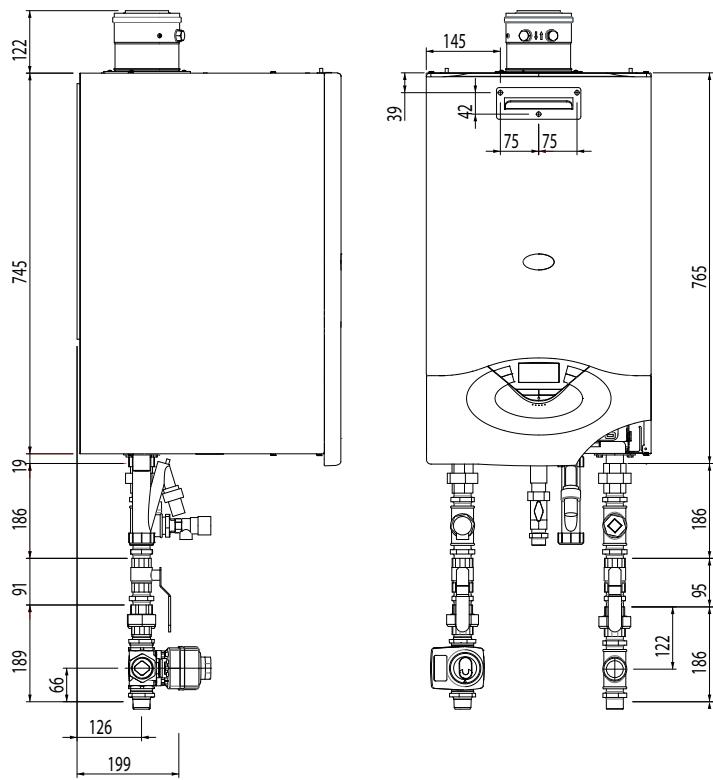

- C82 Flue gas exhaust through individual or shared flue ducting built into the building  
Air intake through external wall

## 13. Cascade sizing

### CASCADE SIZING

Sizing of the cascade systems should be done respecting the following guidelines.

#### Max. boilers in a system:

- LINE configurations can be made with a maximum of 6 boilers;
- B2B (back to back) can be made with a maximum of 8 boilers.

#### Cascade collector size:

- DN65 cascade collectors can be used up to a total output of 462kW;
- DN100 cascade collectors can be used up to a total output size of 1100kW;

#### Low loss header size:

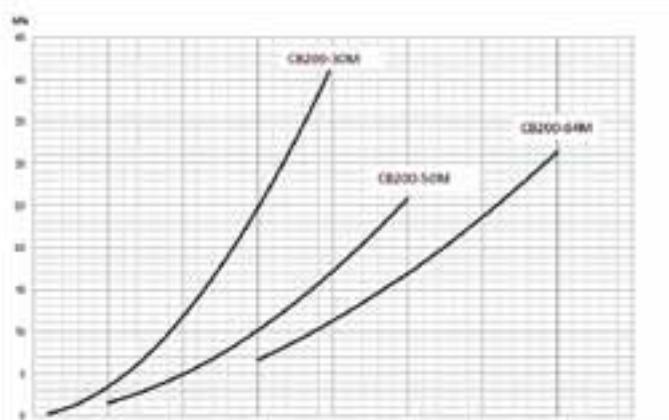

- DN65 low loss header can be used up to a total output of 462kW;
- DN100 low loss header can be used up to a total output size of 1100kW.

### PLATE HEAT EXCHANGER SIZING

For DN65 cascade collector systems, a plate heat exchanger kit is available as alternative to a low loss header kit. Sizing of the plate heat exchanger should be done with respect to boiler output and required  $\Delta T$ . Below table and graph show the relation between these parameters and can be used to select the correct plate heat exchanger kit.

#### NOTE

In case of not using the standard accessories as shown in this manual, then sizing of the different components should be done by the person/company responsible for the system design.

		0-250 kW	251-462 kW
Primary circuit	dT=20K	m3/h	10.8
Expansion vessel		L	4
Secondary circuit	dT=20K	header type	CB200-30M
		m3/h kPa	10.8 9.0
	dT=15K	header type	1 + S2
		m3/h kPa	14.3 20.0
	dT=10K	header type	CB200-64M
		m3/h kPa	21.5 35.8

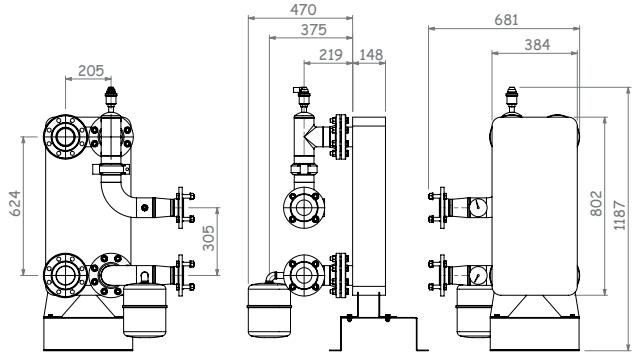

## 13. Cascade sizing

### LOW LOSS HEADER SIZING

The low loss header has the aim to avoid the mutual interaction of pumps working for different circuits. That's the reason why the sizing should be very accurate: a wrong choice of the low loss header can lead to very high  $\Delta$  pressure or  $\Delta$  temperature due to mixing phenomena (the hot water flow can mix with the cold water return). If not considered, the phenomena can affect seriously the performances of radiators and radiant panels.

#### General Criteria

The first method can be used in case of flow speed up to 0,9 m/s.

Considering this restriction, it's possible to ensure a very low pressure drop to the hydraulic connections , allowing the air venting, and avoiding the impurity sedimentation;

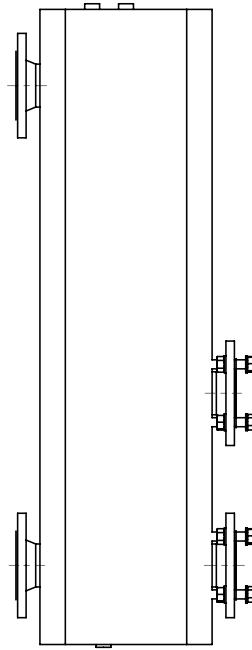

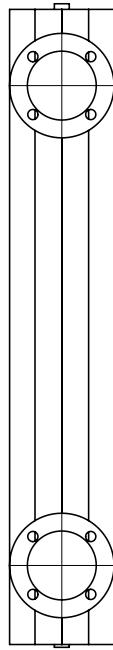

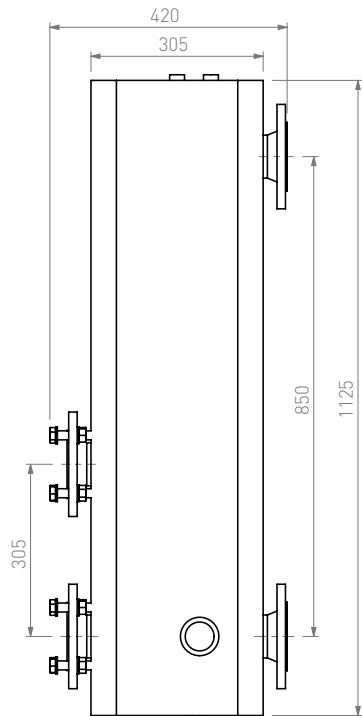

The second method can be used in case of flow speed up to 1,2 m/s.

This approach allows higher speeds due to the configuration that reduces the risk of turbulence and double circulation.

## 15. Exhausts for cascades

### FLUE SYSTEM - LINE

The flue system should always be mounted with a light angle of minimum 3°, in order to enable a proper discharge of condensate from the flue system. To get this angle, the vertical section B should be adapted to the proper configuration from the boiler to the collector.

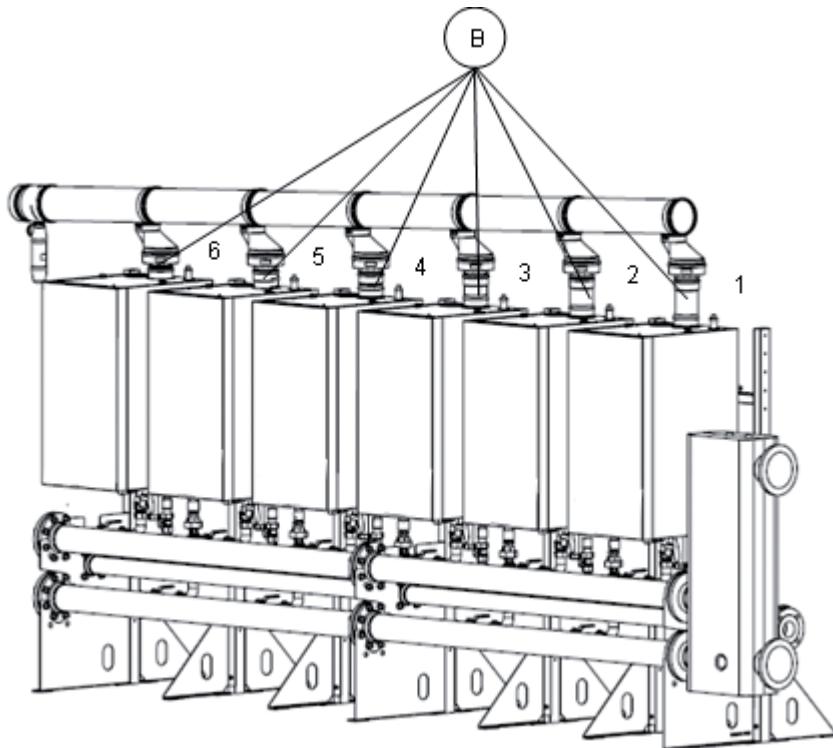

Below the table gives the pipe lengths for the vertical section B for each boiler. The vertical section, in the standard delivery, has a length of 250mm and needs to be shortened accordingly.

#### NOTE:

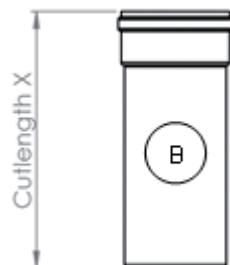

For boiler type 45, an additional adapter from 80mm to 100mm is required for each boiler.

#### NOTE:

The mechanical non-return valve C should always be mounted in vertical position.

Boiler no.	Length X [mm]
1	250
2	216
3	182
4	148
5	114
6	80

## 15. Exhausts for cascades

### FLUE SYSTEM - BACK TO BACK

The flue system should always be mounted with a light angle of minimum 3°, in order to enable a proper discharge of condensate from the fl ue system. To get this angle, the vertical section B should be adapted to the proper configuration from the boiler to the collector.

Below the table gives the pipe lengths for the vertical section B for each boiler. The vertical section, in the standard delivery, has a length of 250mm and needs to be shortened accordingly.

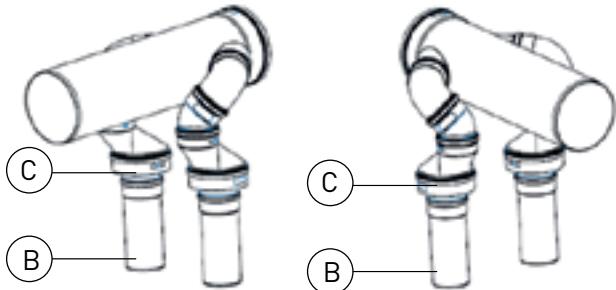

#### NOTE:

For boiler type 45, an additional adapter from 80mm to 100mm is required for each boiler.

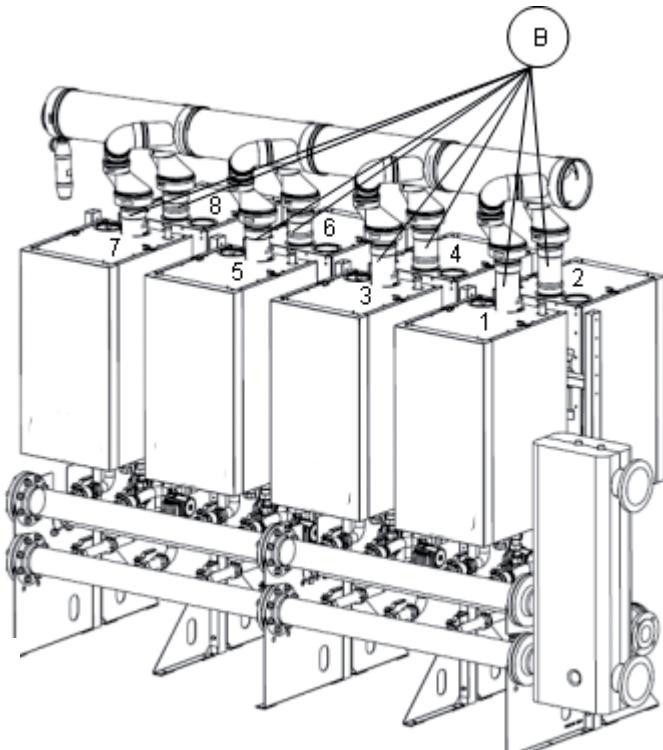

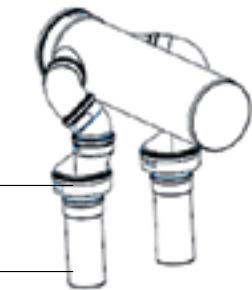

#### NOTE:

The mechanical non-return valve C should always be mounted in vertical position.

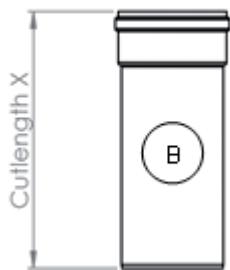

Front view

Back view

Boiler no.	Length X [mm]
1+2	250
3+4	216
5+6	182
7+8	148

## 15. Exhausts for cascades

### Exhaust configuration

#### CHIMNEY SELECTION (diameter for required output):

Diameter	Max. output [kW] by diameter (collector/chimney)		
	Chimney height		
	5m	15m	30m
150/150mm	327	313	288
150/200mm	450	412	370
200/200mm	530	500	482
200/250mm	697	675	646
200/300mm	855	835	797

Calculation based on 3m horizontal flue in boiler room

The cascade flue systems are available with a diameter of 150 and 200 mm. Horizontal collector's and vertical chimney's diameters depend on the total installed power, and on vertical chimney lenght.

The table shows the maximum power, in accordance with the vertical length of the chimney.

The informations are indicative and the proper sizing of an exhaust system depends on the chimney configuration.

Flue system composition	boilers	DN150

## 16. Cascade Management

Thermoregulation accessories for cascade installation	Code	GENUS PREMIUM EVO HP	
<b>Bus Interface for the connection boiler-cascade manager RVS63</b> It is used to connect the cascade manager with the boiler (It is necessary one CoCo MTS for every boiler). With the micro-switch of the CoCo MTS it is possible to assign the identification number to the boiler.	3318642	●	
<b>Cascade Manager RVS63 + wall hung installation box (DE-EN-FR-ES-CZ-SLO-TK-PL-RU-HU)</b> It is the climatic regulator and boilers cascade manager. -to rule three zones (2 mixed zones + 1 direct zone) and one DHW tank -the regulation of a maximum series of 8 boilers in cascade -to provide the ignition priority rotation of the boilers (for a uniform usage) -the division of the power supplied on more generators -thermoregulation management -management of a sanitary circuit With the use of a bus it is possible to connect various peripheral.	3590475	●	
<b>External probe (exc. cable) QAC 34.101</b>	171237	●	
<b>Room sensor (sensor + controls) QAA75.610/101</b> With the Remote control QAA75, it is allowed the complete management of the zone where it is installed and the visualization of the anomaly.	12048253	●	
<b>Motorized mixing valve 3/4"</b> - it's necessary in case of two zone systems with different temperatures, or in case of integration with an external tank for the production of DHW - the management is carried out by the cascade manager	3318145	●	
<b>Motorized mixing valve 1 e 1/4"</b> - it's necessary in case of two zone systems with different temperatures, or in case of integration with an external tank for the production of DHW - the management is carried out by the cascade manager	3318147	●	
<b>Flow sensor QAZ36 (6 mt cable)</b> - it's needed for the detection of the temperature on the header, and on the flow of the heating circuit	12081759	●	
<b>Tank probe</b>		●	
<b>Sensor QAD36 incl. 4m cable</b> Heating zone temperature sensor	11002600	●	

# 16. Cascade Management

## PERIPHERALS CONNECTION

Connecting boilers to the control unit  
The cascade interface PCB is used to connect the RVS control unit to the boilers. One cascade interface PCB must be used for every boiler of the cascade (e.g. 3 boilers with 3 interfaces).

A. boiler connection via BridgeNet BUS

B. RVS63 connection via LPB

C. LED

D. LED

E. micro-switches

### Boiler address allocation

Every boiler communicates with the control unit through the cascade interface PCB. In the cascade operation (maximum 8 elements) it is necessary to allocate an LPB (Siemens BUS) address to each boiler. For the cascade to function properly, a single address must be allocated to each boiler through the corresponding configuration of the "E" micro-switches on the interface. Refer to the adjacent figure for setting the addresses.

### Diagnostics

- LEDs C and D OFF  
cascade interface not connected

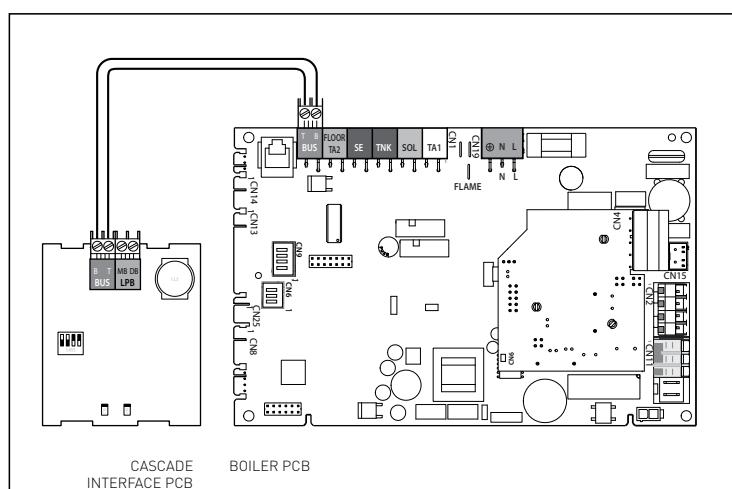

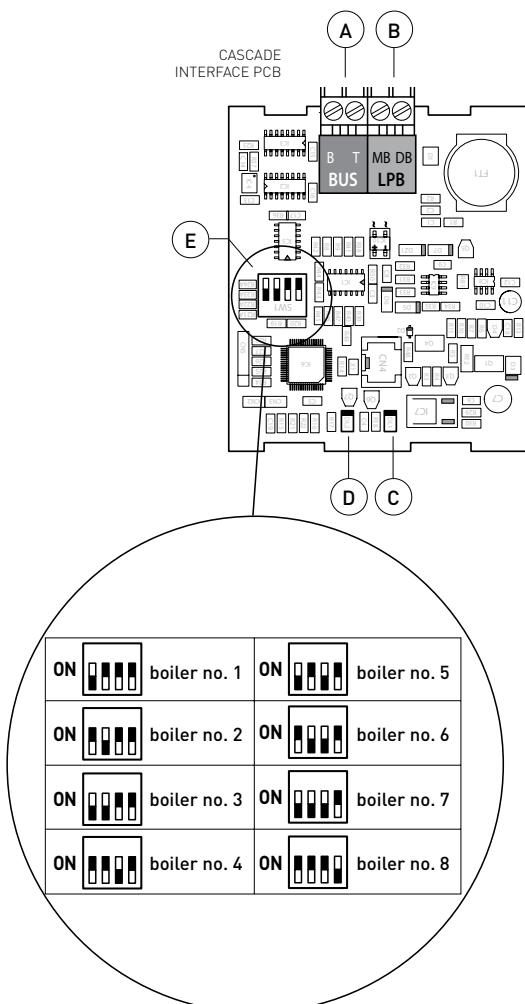

- LED C ON  
cascade interface powered

LPB communication present

- LED D FLASHING  
LPB communication absent

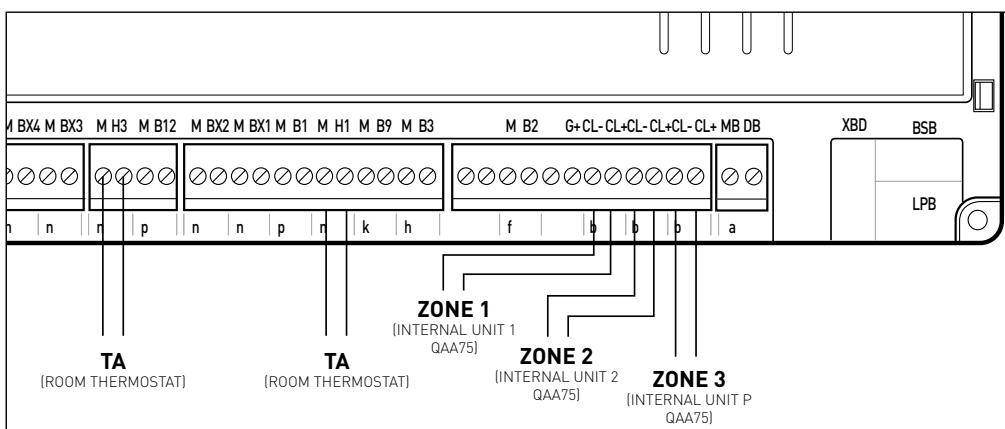

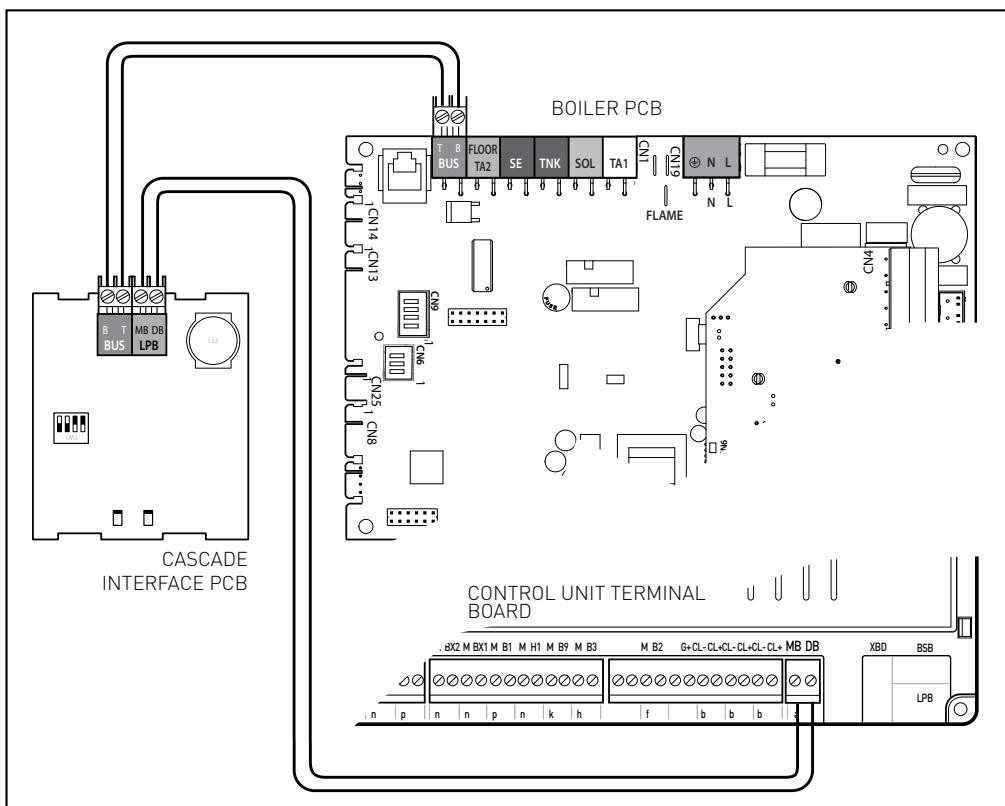

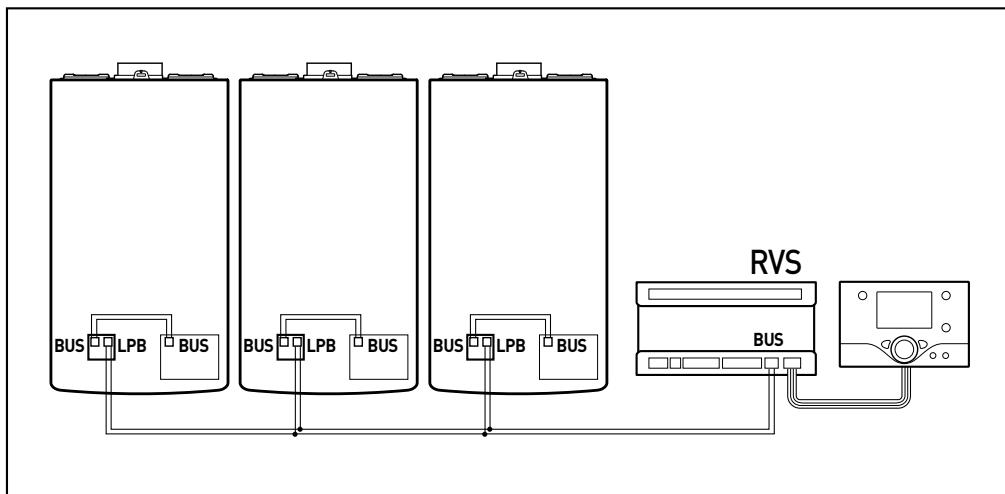

### Connecting the cascade interface PCB to the boiler

The cascade interface PCB is housed in the boiler's instrument compartment. Each PCB is connected to its boiler through the Bridgenet BUS connection. All cascade interface PCBs are connected in parallel to the RVS control unit through LPB.

## PERIPHERALS CONNECTION

# 16. Cascade Management

## CASCADE MANAGER RVS63 - PRODUCT DESCRIPTION

### Buttons

#### 1. DHW operating mode button

For activating domestic hot water production (bar on the display beneath the tap symbol)

#### 2. Heating circuit operating mode button

For setting 4 different heating operating modes:

- automatic clock-based: automatic operation based on time schedule day 24 hours: heating with comfort set-point
- night 24 hours: heating with reduced set-point
- anti-freeze mode: heating disengaged, anti-freeze function activated.

#### 3. Information button

For consulting information without affecting temperature control, heating/DHW operating status, error signals

#### 5. Room temperature control knob

For adjusting the room temperature  
For selecting and modifying settings during programming.

#### 4. ESC button (4)

#### 6. Confirm button (OK)

Both buttons are used together with the - + knob for programming and configuring the control unit.

Pressing ESC allows for accessing the upper level each time; the modified values are not restored.

For skipping to the next control level or saving modified data, press the OK button.

#### 7. Manual operation button

Pressing the button engages the manual operating mode; all pumps function, the mixing valve is no longer controlled and the burner is set to 60°C (the screwdriver symbol appears on the display).

#### 8. Chimney sweep function button

This button has no function.

### Display

Heating with comfort set-point

Heating with reduced set-point

Heating with Frost protection setpoint

Process running - wait

Burner in operation
